Abstract

Shoe upper having а bottomlower end of the upperupper, an outer material with a bottomlower end (19) of the outer material, a waterproof functional layer (16), which has a bottomlower end region of the functional layer with a functional layer zone (20) material, covered by outer and ioining runs in the (17),which stripconnecting band peripheral direction extends in the direction of the periphery of the upper, has a topupper longitudinal side (23) of the joining stripconnecting band, joined (19) of the outer material, the end longitudinal side (25) of the joining bottomlower stripconnecting band, at least partially overlaps the (20) and consists laver zone functional liquefiable sealing material or of material through which liquid sealing material (37; 41) can flow, the joining stripconnecting band (17) having at points of curvature of the bottomlower end (19) of the outer material an arcuate shape corresponding to the local curvature, with different degrees radius of curvature of the two longitudinal sides (23, the joining stripconnecting band, in such a way that, for an arc sector lying in the respective curvature, with a predetermined unitary sector angle, the arc lengths belonging to this arc sector of the (23)of the joining longitudinal sides stripconnecting band differ from each other all the more the greater the curvature in the arc sector respectively being considered.
